E-waste management presents a critical global challenge with profound implications for environmental sustainability, public health, economic development, and social equity. Addressing this issue effectively requires a comprehensive and holistic approach that engages diverse stakeholders, establishes transparent processes and mechanisms, and ensures the necessary resources, including regularity, financial, and requisite infrastructure to manage e-waste sustainably across the value chain.

Join us for a Knowledge Sharing online session exclusively for the Observers and Member States of the Digital Cooperation Organization (DCO), where we will present the DCO new Framework “E-Cycle In Action For Governments” that outlines four key enablers for establishing robust e-waste management systems nationally and across borders across the value chain.

The new E-cycle in Action For Government Framework: what are the different components for an effective e-waste management system?

From Regulations to Awareness: what are the key mechanisms governments need to adopt for an impactful and collaborative e-waste management system?

Bilateral Agreement for E-waste Cross-border Trade: how can governments foster e-waste trade to bridge the digital divide and create a safe digital economy?

Together we can turn this global challenge into an opportunity for economic growth, environmental stewardship, and equitable cross-border collaboration.
